Risk Management WORKSHOP SERIES

Mastering Your Risk
Mastering Adverse Outcomes
Mastering Professional Interactions
Mastering Difficult Interactions with Patients
Mastering Shared Decision Making

MPS has designed these five essential risk management workshops for members to complete over the coming years. Based on MPS’s unrivalled case experience and local knowledge, the three-hour interactive workshops provide proven skills training to reduce your risk of complaints and claims.

To find out more about these workshops visit www.medicalprotection.org

More than 10,000 MPS members worldwide have already taken part in this series.
ON THE COVER

10 The worst of times
The economic recession has had global shockwaves. For doctors, these include unique medicolegal risks – Sarah Whitehouse explores the worldwide situation.

5 MPS international conference
Sarah Whitehouse reports from MPS’s first-ever international conference.

7 Personal conduct
Dr Janet Page explains Medical Councils’ definition of personal conduct, and how MPS reaches a decision on whether or not to intervene.

8 Your new MPS service
Access to MPS medicolegal advice has changed for members in Hong Kong, Singapore and Malaysia.

Welcome
Dr Stephanie Bown – Editor-in-chief
MPS Director of Policy, Communications and Marketing

Wherever you are in the world, it is likely that you are working in an increasingly challenging environment. Financial constraints in your workplace and changes to how healthcare is delivered, and by whom, are complex issues affecting many of today’s doctors.

Globally the population is living longer and presenting with multiple comorbidities that demand increasingly complex interventions. Patient expectations are growing – rightly patients expect high quality, safe care, delivered in a respectful, clearly communicated manner – but there has been a change in the doctor–patient relationship and this is something MPS has written about extensively. The patient is now a consumer and the health service has had to adapt accordingly.

These higher expectations mean that patients are more likely to complain about their care. This is something we have been seeing in numerous reports of growing numbers of complaints against doctors; there is no other evidence that the profession’s standards are declining. I have personally heard concerns from our members that the gap between expectations and deliverables is widening, and that they are facing pressures to do more with less.

It is in times of great stress that your professional qualities come to the fore. Your sense of personal responsibility, pride in the care you deliver to patients, and your aspiration towards improvement are decisive attributes that can make all the difference when under pressure. In such moments your professionalism has never been more important.
MPS was delighted to welcome more than 250 delegates to our International Conference 2012, Quality and Safety in Healthcare: Making a Difference.

Throughout the conference, delegates heard from leading international experts about the importance of listening to patient feedback to improve quality, the need to be transparent and professional when things go wrong, and the cost, both to the doctor-patient relationship and to the doctor's claims experience, in failing to do so.

I have been encouraged by the feedback from the conference so far – 100% of delegates who completed the post-conference evaluation form said that the programme of speakers met their expectations and they would recommend the conference to a colleague.

The real measure of the conference's success, however, will be the extent to which delegates take home the key learning points about improving quality and patient safety – and put them into practice.

Ninety per cent of delegates agreed that they were likely to change something in their practice as a result of attending the conference. One delegate said: “We need to challenge the culture of resistance to openness”; another: “I have a much more positive attitude towards aspects of appraisal because I see the evidence behind it now. I feel confirmed and remotivated in what I do.”

I would be very interested to hear your thoughts on what we can do differently in our organisations to improve quality and safety in healthcare. If you have suggestions you would like to share, please do get in touch.
To achieve a culture of safety, we need to talk to each other. Quality is also about promoting reliability – doctors need to know they will be supported by their organisation if they raise any concerns. Similarly, organisations need to tackle unreasonable variations in the performance of healthcare professionals that threaten safety and quality.

Quality, however, means different things to different people. The pursuit of quality in challenging circumstances has one main goal for Dr Devi Prasad Shetty, Chairman, Narayana Hrudayalaya Group of Hospitals – to dissociate affluence from healthcare. Quality is being able to reduce the costs associated with cardiac surgery, by putting a price tag on human life out of necessity. Delivering cardiac surgery for $800 involves streamlining processes, reducing costs, and involving families as primary care providers.

Typically, it takes a catalyst for new aims to be set, or behaviours to alter. If something goes wrong, writing a policy to improve patient safety is the default mechanism, said keynote speaker Dr Carol Haraden, Vice President at the Institute for Healthcare Improvement (IHI). Yet often, there is no well-developed execution strategy – and so excellent ideas and aims to improve patient safety are lost in documentation. Most healthcare organisations have at least 250 guidelines; yet typically, healthcare professionals only put five into practice. To achieve a culture of safety, we first need a culture of improvement.

The shift needs to come from the top. In every healthcare organisation, there needs to be a board level commitment in everything to do with quality, stressed Professor Martin Elliott, Professor of Paediatric Cardiothoracic Surgery at Great Ormond Street Hospital. Talking about teamwork, leadership and professionalism, he said that leaders need to help define the goals of their organisations, set and maintain standards, and act as role models. Force won’t work: the best leaders never bully, but lead by example.

Forecasting medicolegal risk would allow medicolegal institutions (eg, liability insurers, medical boards, hospital risk management departments) to become more proactive in quality and safety improvement efforts, argued Professor David Studdert, Professor and ARC Laureate Fellow at the University of Melbourne. His study is using a unique national dataset on patient complaints against Australian doctors to develop new methods and tools for predicting a clinician’s risk of a further complaint. Over a ten-year period, 18,900 complaints were received about 11,000 doctors in Australia. The research looked at practitioners’ sex, age, practice location and specialty. For all practitioners, standards of clinical care and communication were the main issues. The more complaints a doctor received, the more they were at risk of further complaints. Prof Studdert explained how the PRONE score (PRobability Of New Events) predicts doctors’ medicolegal risk, which could be used as a simple prediction tool for targeting interventions and reducing clinical negligence costs.

Tony Mason, former Chief Executive of MPS, explored the rise in negligence costs in a global context. For some doctors and hospitals, they have already proved to be unsustainable; in the UK, clinical negligence costs are the highest anywhere in the world, except the United States. The Panel Discussion provoked a lively debate about potential ways forward to address this unsustainable rise.

But the fallout from an adverse event is often not about the money, argued Dr Lucian Leape, Adjunct Professor of Health Policy at Harvard School of Public Health, in his keynote address on disclosure and apology. It is about communicating effectively when things go wrong. A serious preventable injury is devastating for the patient – they are doubly wounded. Not only do they suffer a physical wound (the adverse event), they also suffer an emotional wound, the betrayal and loss of trust in the healthcare professional. A serious preventable injury is a medical emergency. If a doctor does not act quickly, things become much worse. The necessary treatment is open, honest and full communication.

In this medical emergency, there is a second victim, the caregiver. Shame, guilt and fear can take over if the situation is ignored. Apologising or admitting something has gone wrong can be difficult, yet Dr Leape suggests it is essential for the caregiver to heal. Dr Stephanie Bown agreed, outlining MPS’s belief in the necessity of a culture of openness. Legislation cannot work: it only serves to encourage fearful behaviour.

Mistakes do occur. Quality, however, is never an accident: it is always the result of high intentions, said Dr Jason Leitch, Clinical Director at The Quality Unit, Scottish Government, in his keynote address on safety and outcomes. Safer care can only be delivered by frontline professionals doing common things uncommonly well.

To achieve a culture of safety, we need a culture of improvement. John Tiernan, Director of MPS Educational Services, closed the two-day conference with a question: “Delegates from around the world have come to the conference and will leave with great ideas. What will you do with the information you have learnt?”

Visit the MPS website to read the event summary report which features links to videos, podcasts and speaker presentations.
MALAYSIA

Private solution to public shortage

Nursing graduates who hold private nursing diplomas have been offered employment in government clinics and hospitals by the Health Ministry.

The move was due to start in mid-December and was set to see 1,681 diploma holders interviewed for positions across 85 centres all over the country.

Health Minister Datuk Seri Liow Tiong Lai said: “The government has decided to overcome the unemployment faced by graduates from private institutions of higher learning by taking in more nurses into the ministry, to simultaneously resolve the shortage in government clinics and hospitals.”

HONG KONG

HKMA renews regulation call

Doctors in Hong Kong have been reminded to avoid professionally associating themselves with non-qualified individuals, following a botched blood transfusion in a cosmetic clinic last year.

The Hong Kong Medical Association (HKMA) issued the reminder – which is grounded in sections 17, 18 and 20 of the Medical Council of Hong Kong’s Code of Professional Conduct – and also called on the government to regulate all healthcare institutions and medical equipment.

In a press release issued in October, the HKMA said: “We strongly urge the government to legislate and regulate institutions that claim to provide ‘medical cosmetics’ or other medical services. ‘Medical treatment’ should be clearly defined in law so as to protect the public. We propose that the Undesirable Medical Advertisement Ordinance, Cap 231, be extended to encompass cosmetic advertising of a false or exaggerated nature, and those without scientific proof.”

The HKMA also warned members of the public to be wary of “pseudo-science”.

www.hkma.org

Senior HK health figures meet MPS

Senior figures from across the Hong Kong medical field met with MPS in late 2012.

Dr Stephanie Bown, Director of Policy and Communications – and Editor-in-Chief of Casebook – and Dr Ming-Keng Teoh, Head of Medical Services (Asia), spent a week conveying MPS’s views and concerns on behalf of our members. Engagements included:
- Lunch with Dr Leung Pak-yin, the Chief Executive of the Hospital Authority
- Meeting with Professor Joseph Lau Wan-yee, Chair of the MCHK
- “Close encounters” seminar at the Tsuen Wan Adventist Hospital
- Meeting with the Council of the HKMA
- Seminar on Managing Medical Mishaps for the Hospital Authority – Dr Bown introduced the event and hosted a session on “how to break bad news”
- Academy of Medicine (HKAM) and MPS joint forum on “Medicine and the media – public interest or private matters” – Dr Bown delivered a presentation on reputation management
- Meetings with MPS’s local panel lawyers
- An expert training course – which included a keynote introductory address from Ko Wing-man, Secretary for Food and Health.

SINGAPORE

SMC REVIEWS OWN PROCESSES

In light of the criticism received from the Court of Appeal over its handling of the Dr Low Chai Ling case, the Singapore Medical Council (SMC) has announced that a Review Committee will investigate its disciplinary procedures in order to explore ways of improving the system.

A press release issued by the SMC said: “The SMC will appoint a Review Committee chaired by a senior doctor assisted by a senior legal practitioner and comprising senior doctors and other legal practitioners to optimise the disciplinary processes. The Review Committee will look into the administrative processes and develop more efficient and better ways to manage the disciplinary process and mitigate the increase in time and expense for disciplinary proceedings.”

The SMC was criticised for using vague wording in laying out its charges against Dr Low, and for failing to obtain copies of her medical records. The Court of Appeal described the SMC’s charges as “legally embarrassing”.

www.healthprofessionals.gov.sg

PERSONAL DATA PROTECTION BILL

The Personal Data Protection Bill has been introduced in the Singapore parliament. The purpose of the legislation is to govern the collection, use and disclosure of personal data by organisations, and to establish the Personal Data Protection Commission and a “Do Not Call Register”.

www.parliament.gov.sg

VOLUNTARY STERILIZATION (AMENDMENT) BILL

The Voluntary Sterilization (Amendment) Bill has been introduced in the Singapore parliament. It amends the Voluntary Sterilization Act and sets out the conditions under which a registered medical practitioner may carry out treatment for sterilisation.

www.parliament.gov.sg

SMC ANNUAL REPORT

The SMC has published its Annual Report for 2011. The total number of complaints against doctors received by the SMC during 2011 was 153 (152 in 2010). However the number of complaints alleging professional negligence and competence was 96, compared to 44 received in 2010. Other complaints related to rudeness, attitude and communication issues (23), false or misleading certification (10) and inappropriate treatment (5). The number of doctors practising in Singapore was 10,057, an increase of 7.6% over the previous year.

Personal conduct, MPS and the Medical Council

MPS medicolegal adviser Dr Janet Page clarifies MPS’s position on assisting doctors with matters arising from personal conduct

As a discretionary mutual society, MPS exists for the benefit of its membership. Unlike commercial insurers, MPS is not-for-profit and hence subscriptions are set at the level required to meet our liabilities and not driven by shareholders looking for a return on their investment. The interests of individual members seeking assistance have to be balanced against those of the wider membership, ensuring that costs (and hence, subscriptions) are kept as low as reasonably achievable whilst at the same time providing a quality service to members in need.

MPS’s remit has remained unchanged since its formation in 1892, namely, to protect and safeguard the professional reputations of individual members and the professions to which they belong. MPS members are entitled to seek assistance in all matters in which their professional conduct or competence is called into question. This would include assistance in relation to criminal proceedings arising directly from the provision of clinical care to patients, for example, allegations of gross negligence manslaughter or sexual assault during the course of a clinical examination. MPS may also exercise discretion to assist in defending allegations of fraud where these relate directly to professional practice, such as genuine errors on a CV or research fraud. It is unlikely that MPS would assist a member where there is evidence that he/she knowingly lied, broke the law or contravened their professional code of conduct.

Personal conduct

Matters of personal conduct, whether or not these occur in the working environment, or issues arising from the business aspects of practice would not normally fall within the scope of the benefits of membership, regardless of the forum in which the issue was being considered. Thus, MPS would be unlikely to assist in responding to complaints relating to matters such as overcharging, breach of advertising regulations, bullying or sexual harassment of staff or contractual disputes, although each case will be considered on its individual merits.

The range of matters that come before the Medical Council will vary between jurisdictions and reflect the individual regulatory requirements for practice in that country. Whilst the majority of complaints will relate to concerns about the standard of clinical care provided, Medical Councils will also concern themselves with a range of other issues from complaints about the business aspects of a doctor’s practice to convictions for shoplifting.

MPS members are entitled to seek assistance in all matters in which their professional conduct or competence is called into question.

MPS has recently become aware of two areas of particular interest to Medical Councils in Asia. In Hong Kong, there has been an increase in the number of requests for assistance from members following receipt of a notification of inquiry by the Preliminary Investigation Committee for alleged failure to report, within the required timeframe, driving convictions punishable by imprisonment. In Singapore, the SMC has referred a number of doctors to the Complaints Committee for practising without a valid Practising Certificate following failure to log the requisite number of CME points, again within the required timeframe.

Although such matters may ultimately impact on a doctor’s registration and ability to practise, of themselves they do not arise directly from the practice of medicine and hence do not fall within scope of the benefits of membership. In exceptional circumstances, MPS has exercised discretion to assist members with such matters as in the case scenario below.

Case scenario:

In 2001, MPS received a number of requests for assistance from members in Hong Kong in responding to PIC Notices of Inquiry for failure to report driving convictions punishable by imprisonment. Many doctors had been unaware of this obligation until a high-profile case was reported in the media in 2009, following which the doctors reported the conviction on each subsequent application for renewal of their practising certificates. Notwithstanding that the doctors had rectified their earlier oversight, and that in one case, the conviction in question related to an incident 17 years earlier, the Medical Council proceeded to prosecute for failure to notify within the prescribed timeframe. MPS exercised discretion to assist these doctors on the basis that there was evidence that the requirement to report the conviction was not well publicised before 2009, and that all the doctors in question had subsequently rectified their error.

Learning points:

- MPS obligations to its individual members has to be balanced against the duty to the wider membership to use funds wisely.
- Benefits of membership are for matters arising directly from the practice of medicine, namely professional conduct and/or competence.
- MPS will not normally assist in matters of personal conduct or those arising from the business aspects of practice.
- Members should ensure that they are aware of all reporting obligations placed on them by the Medical Council as MPS is unlikely to assist with any investigation into a failure to comply with the regulator’s stipulations.
Your new MPS service

Members in Hong Kong, Singapore and Malaysia now have direct access to MPS’s full range of medicolegal services. MPS medicolegal adviser Dr Janet Page describes the changes and how you can help us help you

MPS is committed to providing you with the best possible service. To facilitate this, we have streamlined our contact point and given you direct access to our wider pool of medicolegal advisers. This article explores these changes and the key questions you need to ask yourself to ensure you get the best out of your membership.

Contacting MPS has never been easier
MPS has introduced a single telephone number through which you can access all MPS services. Members have been provided with a contact card containing the phone number and email address for all enquiries – callers will then be directed to the appropriate service. Emergency advice and assistance can be accessed 24 hours a day.

For non-urgent medicolegal enquiries members are encouraged to email their request to MPS, which will be passed to a member of the dedicated team of medicolegal advisers for Asia. Medicolegal advisers are senior, experienced doctors who also hold a legal qualification. They can provide advice and support in relation to a wide range of professional, ethical and legal issues including advice on preparation of medical reports, handling adverse events, responding to complaints and giving evidence at an inquest. Members are encouraged to contact MPS by email or telephone to speak directly to a medicolegal adviser.

Am I covered?
MPS offers occurrence-based indemnity to its members, which means that you must be in benefit of membership at the time of the incident giving rise to the request for assistance in order to be entitled to assistance. To be in benefit you must be paying the correct subscription for the category and type of work you undertake, your specialty and grade. You should notify MPS promptly of any anticipated change in your professional circumstances. It is important if you decide to undertake new therapies, or to undertake procedures that would normally fall outside the scope of the specialty in which you are indemnified, that you check with MPS whether this would be covered by your MPS has introduced a single telephone number through which you can access all MPS services
existing subscription band, or whether any adjustments need to be made. You should also ensure you inform MPS if you go abroad to work or take a break from practice and wish to suspend your membership.

What am I covered for?
Members are entitled to seek assistance with any issue arising directly from the exercise of their professional (clinical) obligations. This means that as a rule complaints relating to personal conduct (even if they arise in the workplace or come to the attention of a member’s regulatory body) fall outside the scope of the benefits of membership. Such matters would normally include complaints of bullying or harassment, inappropriate comments or touching. It would also include any matters arising out of the business aspects of a doctor’s practice, such as disputes over fees, contractual arrangements or advertising. See the article on page 7 for more information on this.

What else can MPS do for me?
MPS’s primary purpose is the provision of professional indemnity to its members. Dedicated medicolegal advisers work closely with specialist panel law firms to provide high quality advice and representation to MPS members. In addition, MPS offers a range of further services to members. These include access to medicolegal publications offering ethical and professional guidance, online learning, lectures and seminars. MPS Educational Services run a series of professional workshops run by local doctors, focusing on issues such as communication skills, and which are provided free to members.

MPS recognises that facing a claim or a Medical Council inquiry can be a very stressful experience and members may need emotional or psychological support to help them to cope with this. We provide access to a free, confidential counselling service worldwide, which is totally separate from the MPS team handling your case, and which members can access should they so wish. MPS has access to a number of experienced practitioners in various specialties who have offered their services as MPS Associates. These doctors are available should you wish to seek support from a professional colleague locally.

Many cases involving doctors attract unwanted media attention. The MPS press office provides support and advice to members in handling the media, assistance in drafting press statements and liaising with the press on the member’s behalf.

Help us to help you
In order to enable us to confirm your entitlement to assistance with minimal delay, please provide us with your membership number, a current email address and telephone number and the dates of the incident with which you are requesting assistance. It is never too soon to notify us of any problems you have encountered.

Once a file has been opened, your prompt attention to requests for information and co-operation with the legal advisers appointed to assist you will ensure matters progress smoothly and with minimum delay. Early notification will allow us to advise you of any proactive steps open to you to prevent a matter from escalating and to advise against any action that could prove contrary to your best interests.

Dr X was working as a Medical Officer in a hospital in Singapore when he decided to take an extended break overseas. He suspended his membership and advised he would be returning to practice in 12 months’ time. Due to a family crisis, Dr X had to return home for two months in the middle of his trip, during which time he worked as a locum in his old hospital. MPS became aware of this when a claim was brought against Dr X for treatment provided to a patient during his brief return home for which he was not indemnified.

Dr Y was notified by the Medical Council of a complaint made by his practice nurse that he had made inappropriate comments to her during a retirement party for a colleague at a local restaurant, and sought MPS assistance in responding. MPS declined to assist on the basis that the allegation arose out of a social event and was unrelated to Dr Y’s professional practice.
The impact of the recession on healthcare reads like a gloomy checklist of the multi-symptom patient: increased stress, depression and anxiety; an increase in alcohol consumption; an increase in stomach and digestive problems; and an increase in obesity. A study by the Insight Research Group of 300 UK GPs reported that 17% noted an increase in requests for terminations of pregnancy specifically because of financial concerns. Skin complaints are even on the rise. Research by the British Skin Foundation suggests that nine out of ten dermatologists have noticed a marked rise in eczema, psoriasis and other skin conditions triggered by stress. Most dispiritingly, international research suggests that for every 1% increase in the unemployment rate, there is a 0.78% increase in the rate of suicide.

The impact on doctors
But what does all this mean for doctors? Primary healthcare, often the first point of contact, has been hard hit. The Insight Research Group also reported that 77% of UK GPs feel there has been an increase in new cases of mental health conditions in the last four years directly linked to the economic climate.

Secondary care, too, has been affected. In the UK, almost 6,400 people were admitted to hospital with stress between the period January – May 2012, 47% up on 2007-8, when the economic crisis hit. In the Caribbean, public healthcare systems are being stretched as the recession forces more patients to move away from private care. Dr Nancy Boodhoo, MPS Head of Operations, Caribbean and Bermuda, says that this is a particular issue for obstetric care because of spiralling costs.

Maintaining standards
One of the biggest challenges facing doctors is balancing an increase in patients’ needs with maintaining high standards of care. Remember your professional obligation to take a thorough medical history and an examination if necessary – and document both. Record keeping standards can easily slip if a consultation over-runs, but it is important to stop and make notes before rushing to see the next patient. Be aware too of “by the way” comments, where symptoms might be mentioned in passing as the patient is on their way out of the door. These symptoms can often be the real reason behind an appointment, so make sure you...
record them. If it is not urgent, or you do not have sufficient time to give the patient your full attention, you should ask them to come back. If you find that you are so overstretched that the situation is in danger of putting patient safety at risk, or your health begins to suffer, you should raise your concerns within the appropriate channels, for example a senior colleague or your employer.

Act within your competence
MPS has received a number of calls from hospital doctors who feel uncomfortable at being asked to provide cover for an area they do not normally specialise in due to staff shortages. For example in psychiatry, adult psychiatrists are often asked to step in and cover children and adolescent psychiatric care.

Dr Ming-Keng Teoh, MPS Head of Medical Services (Asia) explains that some medical private practitioners seek to maintain their income (as patients turn to the public sector) by choosing to take on a wider range of treatments (eg, GPs undertaking cosmetic procedures), as well as patients (paediatricians seeing adult patients, obstetrics and gynaecology consultants examining patients with breast lumps). Doctors who choose to do this are practising in areas beyond their expertise and may fail to refer appropriately. You have a professional obligation to work within your competence – and should raise your concerns with a senior colleague or employer if you are asked to perform a procedure that you are unsure of.

Managing expectations
Speaking this year at an MPS conference for newly-qualified consultants, MPS Head of Medical Services Dr Nick Clements said: “There has to be a balance between the patient’s interests, the need to control budgets and where the doctor’s duty lies in these difficult circumstances. Often, the buck seems to stop with you, the doctor. If a patient cannot get the treatment they want, or the drugs they want, they will blame the doctor who is saying no. Doctors need to have the right communication skills to handle these situations carefully and manage patient expectations.”

Some patients see making a claim as a financial opportunity in these tough times. In Ireland, the average size of claims against doctors has increased by 37% between 2007 and 2011. Dr George Fernie, MPS Senior Medico-legal Adviser, says: “There has always been tension in Ireland with the public and private mix, but it’s been magnified with the recession. We have seen a case where a doctor reasonably asked a patient on long-term prescription to come in for a review, but the patient felt that this was financially motivated and lodged a complaint.” You should always explain your reasons for calling a patient in for a review, clearly explaining the health benefits and the need for follow-up.

Delaying a visit to the doctor
In some countries, the economic downturn means that patients are accessing healthcare less frequently. In Ireland, those without Medical Cards are increasingly putting off making an appointment, which can have an impact on early diagnosis and the treatment of long-term conditions. Requests for telephone consultations are on the rise, and with them the risks of potential missed diagnosis. Failure to diagnose is a common cause of a complaint or a claim, so it is important to have a low threshold to invite the patient in for a review.

Dr Brian Charles, Emergency Physician and MPS Consultant, based in Barbados, says: “A particularly worrying trend has been patients ‘waiting to get better’ before seeking medical care, particularly those with medical insurance who have to pay upfront and wait for reimbursement later. This has resulted in patients presenting to primary care physicians later in the course of their illness, with more complications.”

Despite the impact of the recession being less marked in Hong Kong, Malaysia and Singapore, which generally have more private practices and less welfare spending, Dr Teoh says: “Recession has had an impact in the public sector, reducing the number of consultations,
as patients are less likely to take time off work to seek healthcare. They cannot afford the time, rather than they cannot afford the cost of healthcare itself.” A reduction in patient numbers has also led to many doctors in private practice resorting to longer opening hours, more practice promotion activities and more turf battles between doctors. The respective Medical Councils do not permit doctors to promote their practice or advertise or canvass for patients, and so doctors may find themselves in murky medicolegal waters if they do try to seek new patients in this way. They are advised to consult and seek legal advice if unsure.

Where does a doctor’s duty lie?
The conflict between a doctor’s duty to their patient, and the patient’s ability to pay, can be all too real. An MPS GP, based in Ireland, describes a case where a patient with depression wanted to wait to pick up his anti-depressant prescription until he was paid. The GP was concerned – the patient had severe depression and was at risk if he did not take his medication. The GP spoke to the pharmacist and agreed to postpone the fees for a few days until the patient was able to pay.

Dr Charles says that in the Caribbean: “Private practitioners are frequently faced with the ill patient who cannot pay (or at least, cannot pay at the time of the encounter), and they too must be compassionate and not put that patient at harm by denying appropriate care. All must be done to ensure that these patients are stabilised and properly referred onwards for the complete care they need.”

Yet doctors must retain a degree of realism. They cannot be responsible for putting right the social and financial woes of all their patients, as well as their ill health. To do otherwise may well result in burnout for the already overstretched doctor. In the UK, the GMC, in Good Medical Practice, states that good doctors “make the care of their patients their first concern”, but “must make good use of the resources available”. Unfortunately, these are not finite.

Conclusion
One small positive can be gleaned from the UK GP research into the effects of the recession on healthcare: 38% of GPs believe that patients who smoke are giving up or cutting down to save money.

However, the pressure cooker of reduced health and increased demand for healthcare continues to affect most doctors. Dr Clements sums up: “Do the best you can with the resources available. Make sure that any resource-related decisions are fair and based on clinical need and remember to be open and honest with patients about the constraints.”

2. Macrae F, Recession is bad for the skin as stress triggers rise in itchy conditions, Daily Mail (31.7.12) [Survey by the British Skin Foundation conducted at the British Association of Dermatologists’ Annual Conference July 2012, 105 doctors and nurses surveyed.]
On the case

Dr Ming-Keng Teoh, Head of Medical Services (Asia), introduces this issue’s round-up of case reports

When treating patients who attend clinics frequently, especially within a short space of time, it can be all too easy to be blinded by a familiar diagnosis based on pattern recognition, particularly if it is a commonplace, and seemingly innocuous, condition.

The safest approach when treating these patients is to go back to basics: document a thorough history and be prepared to re-examine the patient if their symptoms change.

Back pain is one of the most common complaints seen in general practice. Doctors may easily discount it, but it is important to remember that a small proportion of such cases mean serious or life-threatening pathologies. Always remember to ask yourself: “what is it that I cannot afford to miss?” In “Back with back pain” on page 16, Mrs S’s recurrent urine infections, in association with back pain, were found to be co-existing with non-Hodgkins lymphoma. Despite a claim being made against Dr F for failing to refer Mrs S earlier, Dr F’s good documentation of the history and his examinations meant that this was discontinued. Experts found that there was a careful, well-documented assessment of Mrs S on every occasion, which showed that at no time was an emergency referral warranted.

In direct contrast, a claim against Dr W for a missed SAH in “Take me seriously” (page 14) had to be settled for a high sum. There was no evidence in the records that Dr W had taken any history or performed an examination. As a result, Mrs T’s fatal SAH was missed.

Similarly, in “Where the heart is” on page 21, Mr R’s high blood pressure was attributed to anxiety before more sinister pathologies were excluded. His risk factors for cardiopulmonary disease should have been considered when taking the history, examining and arranging follow up tests.

The learning points from all these cases is that potentially serious pathologies should never be discounted before a proper assessment has been made and a detailed history taken. Even so, diseases often do not present with typical symptoms or physical signs. A doctor is not necessarily negligent when he misses a diagnosis, provided he records clearly his findings and is seen to have taken a reasonable history and examined the patient appropriately. Comprehensive records should be made of both.

Since precise settlement figures can be affected by issues that are not directly relevant to the learning points of the case (such as the claimant’s job or the number of children they have) this figure can sometimes be misleading. For case reports in Casebook, we simply give a broad indication of the settlement figure, based on the following scale:

**WHAT’S IT WORTH?**

High US$2,000,000+
Substantial US$200,000+
Moderate US$20,000+
Low US$2,000+
Negligible <US$2,000
Forty-year-old hairdresser and mother-of-three Mrs T had long-term problems with neck pains and migraines. She had seen her own GP Dr W, and many of the partners in the practice, several times over the years with the same complaint. Her symptoms had been largely attributed to muscular spasms due to her job.

One day, Mrs T attended Dr W’s surgery with a headache she felt was much worse than usual. She had also experienced several episodes of vomiting that morning. Although the history of migraine was well-established, the symptoms she presented with “felt different to her usual migraine”. She described pain shooting down the back of her neck, which had never happened before. Dr W documented the consultation with one line in the notes, stating: “Migraine. Prescribed some painkillers.” There was no evidence in the records about any history taken or examination performed.

Over the next three weeks, Mrs T attended four more times with ongoing symptoms, seeing different partners each time. She asked for a private referral to a chiropractor as she thought she had “wry neck” and simple analgesia was providing no relief.

Frustrated with the ongoing headache, she even attended the Emergency Department once but no investigations were carried out, based on the chronicity of her symptoms and her long history of migraines.

Four weeks from the onset of this latest, severe headache, Mrs T had a seizure followed by a fatal cardiorespiratory arrest. The postmortem showed that she had suffered a subarachnoid haemorrhage. Mrs T’s family made claims against all the doctors involved in her care, including hospital doctors, and the case was settled for a high sum.

LEARNING POINTS

- Those who reattend frequently with the same complaint might be seriously ill. A safe approach is to go back to basics, by documenting a thorough history and examination of the problem.
- Listening to what the patients tell you remains one of the best medical tools. A patient with chronic migraine who describes her headache as different to previous ones deserves careful attention. Try not to allow a consultation to be prejudiced by what has happened before and do not let the patient’s self-diagnosis prevent you from keeping an open mind as to the cause of their symptoms.
- NICE have similar guidance: Headaches: Diagnosis and management of headaches in young people and adults http://publications.nice.org.uk/headaches-cg150
- Headache is a common symptom and missed SAH is a frequent source of litigation. Casebook has featured similar presentations of SAH in the past, which may be of interest:
  - MPS Casebook, Not just another headache, 17 (3) (2009)
  - MPS Casebook, Sudden first and worst, 16 (1) (2008)
  - MPS Casebook, Sudden, first and worst again, 16 (2) (2008)
- If aneurysmal SAH is treated urgently, complications can be reduced. Kowalski et al noted that misdiagnosis of SAH in patients who initially present in good condition is associated with an increased mortality and morbidity. They suggest a low threshold for CT scanning and highlight the importance of immediate aneurysm repair – stating that rebleeding occurs in 26%-73% of patients within days or weeks if left untreated. Kowalski R et al, Initial misdiagnosis and outcome after subarachnoid haemorrhage, JAMA 291(7):866-869 (2004) http://jama.jamanetwork.com/article.aspx?articleid=198199
- Remember the importance of lumbar puncture – CT scans may often come back negative.
- Ensure that you keep accurate records, as when a claim is made, evidence is collected from a number of different sources and records may be cross-referenced. For example, hospital records on admission may contain a history that is very relevant in a claim relating to a GP’s earlier actions.
Mrs B was a 35-year-old housewife with two children. She was well-known at her GP surgery since childhood and had needed support with a troubled past. She had suffered abuse as a child and domestic violence in her first marriage. She attended the surgery very frequently with anxiety issues and lots of minor ailments. She would have a list of things that she wanted to discuss each time she attended and consultations would frequently take a long time.

Some years ago, Mrs B had been referred to the breast clinic and was diagnosed with fibrocystic disease. Mrs B mentioned several times on her way out of the doctor’s room of having sore and lumpy breasts. Several of the GPs she had seen had documented this as part of her lengthy consultations and she was examined several times. This, however, always seemed to be part of a “by-the-way” mention rather than a full and detailed examination. Mrs B felt anxious about her breasts and continued to report this when she saw her GP about other things.

Dr T knew Mrs B well and found her to be a challenging patient. He struggled to be able to separate her physical and psychological issues, which were often intertwined. Mrs B always seemed very emotional about her personal problems and Dr T knew he would always run late after he had seen her. He found her increasing breast discomfort was difficult to assess. Dr T had wanted to give fuller attention to Mrs B’s breast symptoms and had asked her to return on another day for a new assessment, but she had failed to attend. Dr T’s partners also saw Mrs B many times and multiple symptoms and issues. A breast examination had been documented several times by different GPs and always mentioned lumpy breast tissue. Fibrocystic breast disease was mentioned on each occasion. After 12 months she was eventually referred to breast clinic with her persistent symptoms. She was diagnosed with breast cancer. Unfortunately, her disease was quite advanced and she needed a mastectomy and chemotherapy.

Mrs B made a claim against the doctors at her surgery for the delayed diagnosis. The case was settled for a moderate sum.

LEARNING POINTS

- Fibrocystic breast disease is a diagnosis of exclusion. If symptoms persist the diagnosis needs to be challenged on a regular basis. The initial diagnosis could have been wrong or it may have evolved into something else.
- Continuity of care is important, especially in reviewing the nature of a breast lump over time. This can be difficult in busy surgeries with many GPs but it is good practice to ensure that it is the same doctor each time in order to make the comparison objective. As more healthcare professionals are involved in a patient’s care, comprehensive notes and good communication are important.
- NICE has published guidance on Improving Outcomes in Breast Cancer (28 August 2002). It has a useful section on managing breast lumps which GPs should be familiar with. The document makes several recommendations, some of which are outlined below:
  1. All patients with possible or suspected breast cancer should be referred to a breast clinic without delay.
  2. Urgent referral (within two weeks) should be arranged for:
     - Patients aged 30 or over with a discrete lump in the breast
     - Patients with breast signs or symptoms which are highly suggestive of cancer. These include ulceration, skin nodules, skin distortion, nipple eczema, recent nipple retraction or distortion (<3 months) or unilateral nipple discharge which stains clothes.
  3. Breast lumps in the following patients or of the following types should be referred but not necessarily urgently:
     - Discrete lump in a younger woman (<30 years)
     - Asymmetrical nodularity that persists at review after menstruation
     - Abscess
     - Persistently refilling or recurrent cyst.
- Beware of “by-the-way” mentions from patients on their way out of the surgery. Sometimes they hide serious pathology. If there is no time for a full assessment, arrange a new, later appointment.
- Challenging patients may require particular care. Patients with complex psychological, social and psychiatric needs can, and often do, have physical problems. There is an interesting article about challenging patients in Casebook (May 2009). It has some insightful case reports and tips on management.
- Patients that don’t attend their appointments raise several issues. Where does the doctor’s responsibility end? What should GPs do about it? It may be useful to have a practice meeting to discuss this and consider developing some practice guidelines about safety netting for did not attend patients.
Mrs S was a 35-year-old shopkeeper with an established history of recurrent UTIs, which had responded well to antibiotics. An ultrasound in the past had confirmed kidney stones.

She presented to her GP, Dr F, complaining of back pain for the past six weeks and tingling in her right leg, which was relieved by lying down. Dr F took a full history and examined her back, including a neurological examination. Dr F diagnosed Mrs S as having sciatica, exacerbated by lifting heavy boxes in the shop. Dr F prescribed regular analgesia and advised her about careful lifting and gentle exercises.

However, the pain continued to worsen. Dr F saw her again four weeks later and this time was concerned as Mrs S was having difficulty walking. She was referred for physiotherapy.

Whilst waiting for the physiotherapy appointment Dr F saw Mrs S again, this time with symptoms of a urinary tract infection including frequency and urge incontinence. Again a urine sample was sent to the lab and confirmed a urinary tract infection, which was treated successfully with antibiotics.

Mrs S’s back pain and right leg sciatica continued to deteriorate to the extent that she could not sit and she returned to the surgery again. Dr F was concerned about the repeated urinary tract infections in association with back pain and the recent onset of incontinence, and informed Mrs S that she felt an ultrasound scan of her urinary tract system would be prudent. A urology referral was made and a CT scan confirmed a renal stone and a retroperitoneal mass. Mrs S had further investigations for the mass and was eventually diagnosed with non-Hodgkin’s lymphoma.

Mrs S was very upset when she was diagnosed, as she felt the back pain had always been due to the mass, and she made a claim against Dr F for failing to refer her earlier.

Experts who looked into the case agreed that the management had been appropriate and Dr F had acted like any other reasonable GP would have at the time. The experts also found that although some of the examinations weren’t examples of best practice, they were not below an unacceptable level. At no time was an urgent or emergency referral warranted.

The case was discontinued after a detailed letter of response was sent.

Back with back pain

Back pain is one of the commonest complaints seen in general practice. Doctors may easily disregard back pain but it is important to keep in mind that a small proportion of them mean serious or life-threatening pathologies.

Taking a good history and examining the patient regularly when they attend without a firm diagnosis with back pain is important, even if they come with a recurrent complaint. Re-examine if there is any change in symptoms. Good documentation of history and examination is safe practice. This helps other clinicians to understand the history of a complaint better. It can be the basis of a good defence if a case ever becomes a claim.

When patients attend with different symptoms and illnesses at the same consultation, differential diagnosis can be more complex and therefore greater awareness is necessary.

Keep up-to-date with guidelines on best practice for back pain. The NICE guidelines for low back pain can be downloaded here: www.nice.org.uk/CG88quickrefguide. This covers management of musculoskeletal back pain but not malignancy, infection, fracture and inflammatory conditions such as ankylosing spondylitis. Remember these alternative differential diagnoses when assessing a person with back pain.

Failure to diagnose is not inevitably negligent. There was a careful, well-documented assessment of the patient on every occasion.

LEARNING POINTS
Mrs H, a 23-year-old professional photographer in her first pregnancy, was pregnant with twins. The pregnancy progressed without any complication, until week 36 when she went into preterm labour. Dr L was the obstetrician on duty. As the first twin was a breech presentation, an emergency caesarean section was performed under spinal anaesthetic and both twins were delivered in good condition.

Soon after the procedure, whilst still in the recovery room, Mrs H began bleeding steadily vaginally and became hypotensive. She was resuscitated with intravenous fluids. Dr L administered oxytocin with little effect, followed by insertion of misoprostol per rectum. He did not follow hospital protocol for postpartum haemorrhage which advised the administration of ergometrine and carboprost if the bleeding continued despite the use of oxytocin. As the bleeding continued, Dr L decided to take Mrs H to theatre for an examination under general anaesthesia to identify the source of bleeding. In the meantime, resuscitation continued with blood products. During laparotomy, the uterus was found to be atonic, but there was no rupture or evidence of any retained products of conception.

Unfortunately, Mrs H’s condition deteriorated and she began to develop disseminated intravascular coagulation. Dr L reported this to the patient’s husband, informing him that “there were no options” other than removing the uterus. It was impossible to gain informed consent from the patient as a consequence of her clinical condition at that time. Dr L proceeded to perform a hysterectomy. Mrs H made a satisfactory recovery from her surgery, but made a claim against Dr L for his management.

Experts were critical of Dr L, as he had failed to follow the hospital guidelines on the management of postpartum haemorrhage and secondly by not considering alternative surgical options such as internal iliac artery ligation or ligation of the uterine and ovarian arteries. Furthermore, Dr L had not documented why he had not considered less radical intervention before resorting to a hysterectomy in such a young woman in her first pregnancy.

The case was settled for a moderate sum.

GM

LEARNING POINTS

- Postpartum haemorrhage remains a leading cause of maternal morbidity and mortality.
- As part of good clinical governance, obstetric departments will have guidelines on the management of massive haemorrhage.
- The management of massive obstetric haemorrhage should be included when practising emergency drills on the labour ward, as well as forming part of regular education for all staff that look after pregnant women. This would help ensure staff are familiar with local guidelines.
- It may be justifiable to deviate from local guidelines in an emergency, but it is very important to document any reasons for doing so.
- Women at high risk of postpartum haemorrhage should have a written management plan, including any prophylactic measures that need to be implemented. Multiple pregnancy is a risk factor for postpartum haemorrhage as a result of uterine atony.
- The decision to perform a postpartum hysterectomy can be a difficult one to make as it will have irreversible consequences. It is good practice to discuss the decision with an experienced consultant colleague.
- Women who have suffered a major obstetric complication should be offered the opportunity to discuss the events with a consultant obstetrician and senior midwife and be offered the necessary support.
Mr P, a 49-year-old taxi driver, had recently visited his local Emergency Department (ED) with chest pain. He ended up being transferred to the regional cardiac unit where, according to his brief discharge advice note, he had “emergency coronary bypass surgery (full discharge letter to follow)”. Three days later after getting home he developed aching discomfort in his right lower leg and reattended his local ED, taking the discharge note with him. He was seen by junior doctor Dr B. Dr B examined his lower leg and noted that the wound from his saphenous vein harvest site looked inflamed. He documented that there were no clinical signs of a deep venous thrombosis and discharged Mr P home with a course of oral flucloxacillin.

The following evening Mr P reattended the ED as he was still getting intermittent pain and was seen by Dr A, a more experienced junior doctor. After examining him Dr A obtained the notes from the previous day’s visit and felt able to reassure Mr P that he simply had not given enough time for the antibiotics to work. Mr P specifically asked about the possibility of deep vein thrombosis, but Dr A advised him that her senior colleague had considered that on his previous visit and felt it was very unlikely. Dr A noted in a statement she wrote for the subsequent investigation that she did not bother her senior on the evening of Mr P’s second visit as “he’d only just gone for a break”. She discharged Mr P with some stronger painkillers.

During the next two days, Mr P rang his GP Dr X on two occasions. Dr X went through his symptoms on the phone and noted that the ED had “excluded a DVT” (he had not received any communication from the ED and had not yet received a full discharge summary from the tertiary unit). He reassured Mr P that he was happy with the assessment in the ED and that he should continue taking the antibiotics and the painkillers prescribed.

The following night Mr P, unable to sleep because of the pain, reattended the ED. By now his leg was cold, pale and mottled. Further investigation identified an embolus occluding his femoral artery, which had arisen from the site of coronary angiography he had had performed via the right groin. Despite the best efforts of the vascular surgical team he went on to require an above knee amputation. Mr P made a claim against all the doctors who had been involved in his care prior to his last ED attendance. The claim was settled for a substantial sum.

**No leg to stand on**

Mr P, a 49-year-old taxi driver, had recently visited his local Emergency Department (ED) with chest pain. He ended up being transferred to the regional cardiac unit where, according to his brief discharge advice note, he had “emergency coronary bypass surgery (full discharge letter to follow)”. Three days later after getting home he developed aching discomfort in his right lower leg and reattended his local ED, taking the discharge note with him. He was seen by junior doctor Dr B. Dr B examined his lower leg and noted that the wound from his saphenous vein harvest site looked inflamed. He documented that there were no clinical signs of a deep venous thrombosis and discharged Mr P home with a course of oral flucloxacillin.

---

**LEARNING POINTS**

- Examine your patient properly and fully – had the entire leg been assessed the femoral arterial puncture site would have been seen and may have led to earlier diagnosis of arterial problems.
- Earlier and fuller discharge letters might have similarly alerted the doctors involved to the fact that coronary angiography had been carried out.
- Reattending patients can easily be perceived as a nuisance, but should instead prompt consideration of why they are reattending.
- Do not rely on a colleague’s earlier diagnosis – they may have been wrong or things may have developed further, providing clues that they did not benefit from when they assessed the patient.
- You should always seek senior input, even if it is inconvenient.
- Beware of blinkered decision-making. Doctors often use heuristic pattern recognition to make rapid diagnoses, eg, one’s intuition, but this can lead to errors if the wrong pattern is recognised and alternate diagnoses are not considered. Keep an open mind. Do not be afraid to rethink your original diagnosis.
- Pain out of keeping with the clinical findings or diagnosis should always prompt review – and merits more than telephone advice, especially when a patient has undergone major surgery.

---

**REFERENCES**

2. Williams S, Tunnel vision, Casebook (May 2011)
Mr C, a 40-year-old carpenter, attended his local Emergency Department (ED) with a severe headache, vomiting, blurred vision and photophobia. These symptoms responded to analgesics and antiemetics. History and examination suggested possible intracranial pathology. The CT scan performed showed no evidence of a subarachnoid haemorrhage but did show a large tumour in the pituitary fossa. Recently appointed consultant neurosurgeon Mr Y was soon involved in Mr C’s care. He requested immediate ophthalmology assessment and a visual field defect was excluded. Mr Y arranged a pituitary function test but proceeded to immediate surgery. He chose craniotomy, adopting a subfrontal and transsylvian approach to remove the tumour. The procedure was complicated as the tumour was very friable. Postoperatively Mr C had a dense hemiparesis. A repeat CT scan revealed extensive capsular infarct on the left side of the brain and a lacuna infarct on the right. It took several months for Mr C to recover any independence and he was left with right-sided permanent neurological damage with hemiparesis. Subsequently he was also found to have raised prolactin levels and ACTH and gonadotropin deficiencies requiring hydrocortisone and testosterone. He made a claim against Mr Y.

Expert opinion was critical of Mr Y’s management on various counts. Preoperatively Mr C had normal vision so he was not at immediate risk of blindness as a consequence of pressure on the optic nerve. However as the tumour enlarged he may have been at risk of pituitary infarction (apoplexy), further affecting the hormonal function of the pituitary gland. Cases such as this are usually managed jointly with an endocrinologist who will assess the function of the anterior and posterior pituitary, by appropriate biochemical tests, such as stimulatory hormonal testing, and for posterior pituitary, a prolactin level.

Medical management could delay surgical intervention if the optic nerves were not at risk and the tumour size did not suggest a risk of infarction. The experts were also critical of the surgical approach, which was not in line with usual practice. They agreed that there was no clinical indication for the urgency with which this procedure was undertaken; had an MDT assessment been undertaken he wouldn’t have had surgery. The case had to be settled for a high sum.

CS

LEARNING POINTS

- Patience and an awareness of one’s own expertise and knowledge are vital to practise safe surgery. It is rarely appropriate to rush into a procedure, particularly if this means there is a risk of taking an incorrect or risky approach.
- A surgeon may need to take rapid and difficult decisions intraoperatively; however, preoperatively it is important to take appropriate time to review all investigation and treatment options to ensure the best outcome for the patient.
- In medical practice recognising one’s limits (cognisance) and accepting that something may go beyond one’s expertise and training is essential for good medical practice. This might be particularly hard for newly-appointed consultants eager to establish their clinical practice and expertise to their senior colleagues.
- It is important to gather all the facts available to define the clinical situation of the patient before deciding on any management plan. It is here that joint or team working may be appropriate and helpful. In retrospect, in this patient, there were a number of unanswered questions such as the precise nature of the lesion; whether more tests should have been carried out to define the situation; whether the surgery was needed at that time; and whether the patient was at risk of pituitary apoplexy.
- Working as a team provides an extra safety net to medical practice. In areas such as pituitary surgery, it is common practice nowadays to work in conjunction with the endocrinology team, who can give advice on the medical investigations to define the patient’s problem and assist in postoperative hormone replacement as appropriate.
Ms W, a 45-year-old secretary, had poliomyelitis as a child, which left her with a leg length discrepancy, the right leg being several cm shorter than the left. Despite the obvious cosmetic appearance and impaired functional mobility, she had never thought of having any form of treatment. However, one day she watched a programme on TV about surgery to lengthen limbs, so she asked her GP to get her an appointment to see the surgeon involved in the programme, Mr A.

Mr A saw Ms W in clinic; soon after she had a date for her surgery. Mr A did not document any counselling of the potentially serious side-effects or the intensive physical therapy that would be required after the surgery. All the people in the TV programme had had great results. Mr A did not explain that this was not always the case, nor was the risk that she may be worse off after surgery explored. Mr A only made brief notes at the initial consultation, the operation and follow-up with no documentation about explanation of risks and complications.

Unfortunately, the postoperative progress was not good and Ms W suffered incapacitating pain. Over the course of a few months Ms W experienced progressive stiffening of the ankle and was subsequently left with an equinus contracture. During the next few years she also developed a valgus deformity of her proximal tibia with some procurvatum. Her mobility deteriorated. The cosmetic appearance of her leg, although longer, was no better and overall her clinical condition was worse than before the operation.

Eventually Ms W made a claim against Mr A. The experts involved thought it was difficult to decide how much of her subsequent problems were due to the surgery and poor quality of follow-up, or because of post-polio syndrome. However, due to lack of adequate medical notes, to demonstrate adequate warning of risks, the case could not be defended and was settled for a substantial sum.

RM

LEARNING POINTS

- Patients can often take away unrealistic expectations from what they see or read about in the media, and increasingly in social media. In these circumstances it is even more important to explore expectations about realistic outcomes, take proper consent and document appropriately. Remember good notes at all stages are the cornerstone of your defence.
- It is important that the patient fully appreciates all that is involved, not just in the surgery but in the follow-up. This can sometimes influence the final outcome as much as the operation itself.
- This case highlights the importance of a robust consent process when using innovative techniques.
- Limb lengthening surgery is highly specialised and complex. There are numerous recognised complications and these must be made clear to the patient.
- It can sometimes take more than one discussion before the patient is able to make a fully-informed decision to proceed with surgery.
- It is important to make timely decisions.
- MPS’s workshop Mastering Shared Decision Making is available via the MPS website.
Fifty-five-year-old Mr R had a history of hypertension for which he was taking an ACE inhibitor. He attended his GP, Dr S, with intermittent tightening of the chest and a sense of breathlessness. He did not have any symptoms of nausea or pins and needles. Mr R felt that he was suffering panic attacks, especially as he had recently been made redundant and was experiencing financial difficulties. On examination, Mr R’s blood pressure was found to be high and Dr S attributed these symptoms to anxiety. However, he arranged an ECG and routine blood tests and asked Mr R to return to discuss the results.

When the results were available, Dr S considered the ECG for any abnormalities of rate, rhythm or appearance, and looked for changes suggestive of myocardial ischaemia or infarction. He felt that the ECG was essentially normal, aside from mild tachycardia, and did not see any gross abnormality requiring emergency admission. Two days later, Mr R attended the surgery as an emergency, complaining of chest pain, shortness of breath and nausea over the weekend. Dr S saw him before surgery began in the morning and arranged for emergency admission to hospital. The ECG and blood test results were sent along with a handwritten referral letter. Upon admission to hospital, Mr R clinically deteriorated and CPR was given; however, Mr R died within an hour of admission. The postmortem found that Mr R had a large saddle embolus in the pulmonary artery causing complete obstruction of the lumen. The left popliteal vein showed residual deep venous thrombosis and that this was the likely source of the fatal embolism.

Mr R’s widow made a claim against Dr S. Expert opinion criticised Dr S for his initial diagnosis of anxiety, his failure to consider that Mr R’s symptoms were potentially life-threatening and for failing to note that the ECG showed right bundle branch block and right axis deviation compatible with pulmonary embolism. Mr R should have been referred to hospital when he initially presented with chest discomfort, where a cardiologist would have diagnosed him and Mr R would have survived. The claim was settled for a moderate sum.

LEARNING POINTS

- Mr R had a number of risk factors for cardiovascular disease, including his age, high blood pressure and other symptoms that could possibly relate to circulatory problems. In any patient with chest discomfort you need to rule out serious cardiopulmonary causes with a careful history, examination and ongoing referral if warranted.
- You should offer a patient for further assessment if an ECG is abnormal if they have risk factors for cardiovascular disease. Mr R should have been admitted to hospital to exclude an MI, even if Dr S was unsure of the diagnosis, because of his risk factors for cardiovascular disease.
- Be aware of non-cardiac causes of chest pain. In this case, the history, in combination with tachycardia, pointed towards pulmonary embolism. However, the doctor only excluded a cardiac cause without considering embolism.
- Anxiety symptoms can be very similar to symptoms of more sinister pathologies. When assessing someone with a history of or new presentation with anxiety symptoms, consider risk factors for cardiopulmonary disease when taking the history, examining and arranging follow-up tests.
Mr Y was a 21-year-old unemployed man who lived with his mother. He was a heroin addict and in the last few months, he had started injecting into his groin. Each day he was buying heroin and cocaine and had recently served a prison sentence for burglary to fund his habit. Mr Y was well-known at the practice as he had attended since his childhood. The practice had supported him and his mother with some behavioural problems at school and with issues around domestic violence before his father had left home. His mother had schizophrenia and was also a regular attender at the practice.

Both Mr Y and his mother had been a case for discussion as practice staff were finding them increasingly difficult to manage. Lately, they had both been regularly missing appointments and were rude to staff. Mr Y frequently requested appointments for minor ailments, such as lower back pain and colds, yet upon attending he asked for methadone or pethidine. His behaviour was rather manipulative and consultations were often challenging.

During one month, Mr Y attended several times complaining of back pain and feeling unwell with flu-like symptoms. Dr S and his partners saw him and documented their history and examination. It was recorded that he was suffering with severe back pain and feeling “hot and cold”. His temperature had been recorded as 38.9 degrees. A blood test had been arranged, which showed a significantly raised ESR and white cell count – the results were not acted upon.

Mr Y began to feel worse and was struggling to get out of bed due to the severity of his back pain. His mother attended the surgery on her son’s behalf to ask for a home visit, but one of the receptionists refused the request and asked the patient to attend surgery. She mentioned later that Dr S had said previously that “he couldn’t do any more for the family” and that she was trying to help.

The next day Mr Y felt very weak. He tried to get out of bed and collapsed. His mother called an ambulance and he was rushed to hospital. He was diagnosed with endocarditis and discitis. Despite intravenous antibiotics he died of overwhelming sepsis. His mother was devastated and made a claim against Dr S’s surgery. The case could not be defended and was settled for a moderate amount.

LEARNING POINTS

- Frequent attenders can and do have serious illnesses; doctors must not let an element of “crying wolf” blind their judgment. It is important to keep this awareness and objectivity when seeing patients.
- When investigations are requested it is important to have a system in place to ensure they are acted upon if necessary.
- Effective triage is an integral part of general practice and is better based on clinical need rather than catering to the most persuasive or demanding patients. An effective triage system could help direct patients to the most appropriate appointment at the most appropriate time, and identify patients who have an immediate medical need.
- The management of patients who are drug users raises issues that may need discussing within the practice to offer better care. For example, there should be an awareness of the guidelines to support patients with addiction including where and how to refer patients for support and/or detoxification, and offer “shared care” for the management of drug misuse.
We received a large amount of correspondence regarding last issue’s case, “Slipping through the cracks”. We have published the letter below as an example of the concerns raised, which were similar across all the letters we received. MPS’s response is also below.

Slipping through the cracks
We have read and generally agreed with most of Casebook’s reports over the years; however, I really do not understand the outcome here. My husband (a GP) and I (an emergency physician) cannot fathom how the GPs are involved in this case. They tried their utmost to engage this patient by recalling him, starting an antihypertensive and making an outpatient appointment.

If a patient does not follow up any leads offered by a GP, denies any medication/health issues and uses multiple health services, it’s very difficult to see how else he could have been helped.

We understand there are many more unknown patients have to take some responsibility for their health too.

Dr Sally and Jonathan O’Keeffe, UK

Response
Many thanks for your recent correspondence about the case report, “Slipping through the cracks”. We have, perhaps unsurprisingly, received many letters and emails from members working in different specialties and different countries, expressing similar views: Why was the case settled? What more could the GP have done? Where does the patient’s responsibility lie?

On reviewing the claim, there are a number of differences between the facts of that case and the facts described in Casebook, such that the material omissions (failure to adequately monitor or manage significant hypertension in presence of multiple cardiovascular risk factors) which led to expert criticism in the case, do not appear in the account given in Casebook. I offer my personal apology for this – we do change details of cases prior to publication so that anonymity of the parties is preserved, but on this occasion the changes severely compromised the credibility of the case and this was not picked up by our editorial process. Indeed, it is your MPS Editor-in-Chief who has ‘slipped through the cracks’ on this occasion. And we have some learning points to ensure that this does not happen again.

I am heartened to some extent that so many of you have taken the trouble to put us right, but am extremely sorry if the report caused unnecessary anxiety.

Dr Stephanie Bown, Editor-in-chief

A pain in the leg
I cannot disagree more strongly with your conclusion that Dr C had done everything she could and should have done. Clinical examination along with “Homan’s sign” should be consigned to the clinical dustbin. How many more people will die from undiagnosed DVT causing a massive PE through a clear lack of understanding? You should be shouting the message loud and clear that a normal clinical examination has absolutely no predictive value in excluding a DVT whatsoever. It is useless!

Even a Wells score of 0, which it would have been in this lady, places her in the “Low risk” group. This is not the same as no risk.

What Dr C should have done is a d-dimer. Forget her fabulous documentation. There is no clinical finding that excludes a DVT. That you defended the claim successfully is a travesty. A life was lost. A positive result would have led to a Doppler USS, which may just have saved her life.

Dr S J Wallace, UK

Nasogastric tube errors – 1
The article relating to errors surrounding nasogastric tube placement (Casebook 20 (3)) raised several important issues pertinent to both junior doctors and also radiology performance and interpretation. The article mentions specifically the timing of tube placement and imaging – as far as possible this should be done in working hours when senior doctors and radiologists are available to assist with image evaluation.

Junior doctors will need training in chest radiograph interpretation, but often these radiographs are done in sick patients and image quality is poor, making assessment difficult even for more experienced doctors. Junior doctors must be able to appreciate when they need help and should ask for senior advice if there is any doubt; all decisions and consultations must be clearly documented in the patient record.

The article covers also in some detail how to approach a chest radiograph following tube placement – it does not mention some crucial points, namely that before any attempt at image interpretation is made the reviewing doctor must check that the film is of the correct patient done at the correct time and date. This is essential, especially on ITU for example, where a patient may have multiple chest radiographs in a day – errors are still made when the incorrect film is reviewed and cleared.

There is also the issue, alluded to in the article, of getting radiographs formally reported by a radiologist, ideally on the same day for inpatient work. This is a problem area in many trusts, with often long delays in getting inpatient films reported, or in some cases not reporting them.
Primary postoperative care

There’s a theme running through increasing numbers of the recent medical incidents reported in Casebook that does not entirely seem to have been picked up by your case report writers and I believe is worthy of discussion. This revolves around the increasing pressure on hospital doctors and medical teams to discharge patients as rapidly as possible back to primary care.

A case in point was in the article "A normal appendix" in the May 2012 issue, where a patient subsequently found to have a Meckel’s diverticulum as the source of problems was discharged one day after appendectomy in such apparent haste that neither the consultant nor the trainee saw him, and the article also makes clear that no follow-up appointment was offered. Subsequently the patient made numerous visits to his GP and to hospital Emergency Departments before the real reason for the problem was identified.

This pressure on hospital doctors to ‘get rid’ of their patients back to the community is encapsulated in a set of rules known as NTFUR (new to follow-up ratios) and is being applied ever more ruthlessly across the country. A figure for the average ideal number of times a patient should be seen by a certain specialty (and not by pathology) is devised without published evidence and imposed upon specialty departments.

Often the ratio is well under one to two. Lead clinicians whose departments do not stick to the figures are called in by administrators (as I have found myself) and pressured to comply.

Clearly, because hospital care is seen (often wrongly) as expensive, the stimulus for this is cost-savings. However, it should fail to us as medical professionals to point out the very considerable dangers and indeed false economies. Firstly there is often no continuity of care because GPs understandably often feel unable or unwilling to deal with the nuances of postoperative care.

Patients such as that in "A normal appendix" suffer needless delays and sometimes injury in reaching the real diagnosis. Finally, over a longer period there’s a massive loss of skill, experience and learning because surgery does not end at the door of the operating theatre or ward. It ends when the specialist discharges the patient from the follow-up clinic cured of his/her symptoms, and it’s often during that follow-up that as a surgeon one realises one has missed something or perhaps done something less well than one might have. The changes now being forced away from us by NTFUR reduce the experience and excellence of doctors, nursing and clinical support staff. The problem applies equally in public and private practice where insurers are starting to apply the same pressures. Professional organisations and indeed our indemnity providers need to support doctors in dealing with this.

Mr Peter Mahaffey, UK

Nasogastric tube errors – 2

We write in reference to the special feature article regarding nasogastric (NG) tube errors.

The guidance that you quote from the NPSA is very difficult to implement in practice in many clinical circumstances. There are unintended consequences that expose patients to risks from repeated doses of radiation with multiple x-rays and failure of delivery of nutrition or medication for long periods; as well as increasing healthcare costs. The evidence quoted in the NPSA guidance is weak and focuses on small numbers of serious adverse events, while ignoring very large denominator numbers of tens of thousands of patients who receive NG feed to put numbers into perspective.

While we were pleased to see an article highlighting this important and preventable cause of morbidity and mortality in healthcare, there was a vital omission in the discussion: the implications of acid suppressing drugs for confirmation of NG tube position. Many critical incidents occurring with misplaced NG feeding tubes occur in ventilated critically ill patients. This group of patients frequently receive prophylaxis against stress ulceration with either an H2 antagonist or proton pump inhibitor, in line with national and international standards of care for ventilated patients. The administration of these drugs frequently results in gastric aspirate that is above pH 5.5, necessitating a chest x-ray as proof of correct NG placement. The bullet point relating to repeat checks states that NG tubes “can be dislodged so they should be checked every time they are used, by aspirating and confirming a low pH, and only x-ray if this is not the case” – this needs further clarification.

In a group with increased gastric pH this would mean a chest x-ray every time an NG drug is administered – possibly multiple times over the course of a day. We would suggest that
The major difficulty with x-rays on a daily basis will not be a problem later. GPs are well aware of how at the moment in time they are used to if the cm marker at the time they are used to "if anyone may write anything they like about a doctor. There is no restriction, there is no sanction against a derogatory or even malicious review. Dr Bacon says that reviews are the norm in other service sectors. There have been documented cases of damaging reviews written by rivals of commercial organisations, the writer never having partaken of the service on which they are commenting. The motive is plain: to put a competitor out of business. Tracking these people down requires cyber detective work and there is no guarantee of success. The derogatory information might even be passed through a server in another country so it becomes difficult to invoke UK law – which itself offers scant protection anyway. Hoping that a site is "secure, robust and has proven systems to prevent abuse" is no more than wishful thinking. Nothing on the internet is that secure. How does a doctor "ensure" that a site is secure, anyway? How many of us would understand the security measures in place, let alone be allowed to know their exact nature and function? Indeed the observation of illness over time is an essential part of our trainee GPs' learning experience. Patients on the other hand seem to treat the reassurance as not anchored in time as it were, and treat it as if it could be considered as ongoing: "The doctor told me it was eight six months ago, so it's ok now..." It seems that the lay belief is that all problems are obvious from first presentation. Perhaps patients also underestimate the time it was since they last consulted about the problem and thus falsely believe that the reassurance is more recent than it actually was. From our point of view it all seems so unfair. While this might raise the possibility that patients could consult too soon and be given false reassurance before the problem becomes clearer, the issue for us is to communicate the need to reattend if the problem gets worse, or other symptoms develop. So: are we approachable? Can we somehow give permission in advance to come back as well as showing a personal interest? A phrase offered to our trainees to adapt is something along the lines of: "If this thing misbehaves itself in any way I want to know about it..." Trainee GPs would be asked to record a contingency plan (in this case an ultrasound scan) to give some idea of what is expected. Another possible technique is to inject some deliberate uncertainty such as "I think that's OK, but you must let me know if..." Dr Paul Vincent, UK

The internet: target practice? This letter refers to an article that was in our UK edition only. To read it, visit: www.medicalprotection.org/uk/casebook-september-2012/getting-the-best-out-of-online-reviews. The suggestions in the article “Getting the best out of online reviews” by Neil Bacon surprised me since they are the exact opposite of what I’d advise. I’m not aware of “powerful benefits” of online reviews. What is possible is that anyone could write anything they like about a doctor. There is no peer editing, there is no restriction, the writer cannot be identified (they might not know who they say they are) and there is no sanction against a derogatory or even malicious review.

Dr Bacon says that reviews are the norm in other service sectors. There have been documented cases of damaging reviews written by rivals of commercial organisations, the writer never having partaken of the service on which they are commenting. The motive is plain: to put a competitor out of business. Tracking these people down requires cyber detective work and there is no guarantee of success. The derogatory information might even be passed through a server in another country so it becomes difficult to invoke UK law – which itself offers scant protection anyway. Hoping that a site is “secure, robust and has proven systems to prevent abuse” is no more than wishful thinking. Nothing on the internet is that secure. How does a doctor “ensure” that a site is secure, anyway? How many of us would understand the security measures in place, let alone be allowed to know their exact nature and function?

Information on one website quickly spreads and copies appear on others. Look at how social networks have become the new playground for school bullies. It just takes one disgruntled patient to ruin your reputation through the web – and you can’t stop it. The greatest difficulty is removing adverse comments. There is no enforcement to make sure this happens. Many websites have no direct means of contacting their operators, there’s no compulsion to reply to any email you might send them. Finally, what if you disagree with something an identifiable patient says about you? Any reply would be breach of confidence; it’s the same problem as when trying to handle adverse newspaper publicity.

There are various branches of engineering – civil, mechanical, electronic, etc. The new discipline of socially-appropriate engineering is now becoming recognised. Of any technical achievement, it asks not can we do it, but should we do it? Yes, you can hand out cards to encourage patients (or anyone) to publish comments about you on the internet. Should you do it? Of course not. You can stick your head over the parapet if you want, but when they start to shoot, you can’t stop them.

Dr Godfrey Manning, UK
The Creative Destruction of Medicine by Eric Topol
Reviewed by Dr Muiris Houston, medical journalist and health analyst

Not that long ago a discussion about “digital medicine” could only be construed as a reference to rectal examination. Such has been the pace of technological change and of the digital revolution, that an updated form of digital medicine is now unquestioningly seen as part of modern medicine’s cutting edge.

In his book, The Creative Destruction of Medicine: How the Digital Revolution will Create Better Health Care, Eric Topol, chief academic officer for Scripps Health, a non-profit healthcare system based in San Diego, argues that the digital revolution can democratise medical systems in a groundbreaking way. The creative destruction in the book’s title comes from Austrian economist Joseph Schumpeter, who popularised the term “creative destruction” to denote transformation that accompanies radical innovation.

Topol boldly predicts the end of ‘one-size-fits-all’ medicine; instead patients can look forward to personalised and customised solutions for their health problems. It is almost Nirvana-like: as we collect ever more complex medical data about ourselves we can look forward to more personalised care at the point of delivery.

Informed consumers will be in the driving seat, controlling their own healthcare based on genomic information and real-time data obtained wirelessly through nanosensors.

Social networking will play a major role as ever-widening online health communities provide us with peers whom we never meet but who become crucial guides as we come to terms with our illness.

Topol really is convincing on the technological aspects of this coming revolution. But readers may have greater difficulty envisaging the consultation of the future. What will happen in the valuable crucible of the doctor – patient interaction?

In the years ahead Topol says he expects up to 70% of office/surgery visits will become redundant, “replaced by remote monitoring, digital health records and virtual house calls”. But there is no convincing narrative to back this up, leading this reviewer wanting a follow-up volume in order to be entirely convinced that Topol’s transformation can work in the trenches of frontline medicine.

Thinking Fast, and Slow, by Daniel Kahneman
Reviewed by Dr Mareeni Raymond, GP in London

Daniel Kahneman’s book was recommended to me at my GP study group, my colleague telling me it was a must-read for any doctor. The book has been a bestseller since it was published in 2011 and having just read it I can see why. I couldn’t put it down.

Kahneman is an Israeli American psychologist who has published some of the most well known and important papers on the subject of behavioural psychology. This book covers some of his and his colleagues’ most notable ideas, experiments and theories about decision-making, behaviour and judgment.

Although his book may at first glance appear to be aimed at business people and economists it gradually becomes obvious that absolutely anyone could relate to the book’s principal ideas, and could benefit from an understanding of the psychological theories described. As doctors we need to make quick decisions about patients as well as the interpretation of clinical information and statistics. We expect our decisions to be based on experience, intuition and knowledge. However the conclusions each person draws are different and this book clearly describes the possible reasons why.

Our brains are tainted by presumptions and are subconsciously influenced by what we are exposed to in our daily lives. This is partly about cognitive bias, which Kahneman describes in the first part of this book.

If you are a person who questions what is happening around you, and is interested in understanding your own thought processes with a view to improving judgment, you will be enlightened. Take for example the effect of cognitive bias: it can lead to mistakes, inaccurate judgments, irrational behaviour and illogical conclusions. Perhaps we know that we are influenced by what is around us – that isn’t a new idea – but what is so powerful about this book is that it points out totally unexpected and unpredictable influences on our state of mind. When a patient walks into a room there are hundreds of reasons why you may come to a conclusion – by understanding those reasons perhaps you can check yourself – that is, think slow, rather than fast, and make better judgments.

The reader may be put off by the potential of complex ‘science bits’ and long words – this is not something to be worried about. It is a bestseller because it is accessible, written in an informal way, each chapter peppered with example questions, scenarios, and details of experiments that clarify the arguments made for each of the theories.

Today our minds are heavily bombarded by mass media and marketing, and Kahneman’s book also helps us unravel the decisions we make outside the workplace. After reading the book perhaps having an understanding of these shortcomings will make us question our decision-making, our behavioural responses and our confidence in judgments, but hopefully in a positive way.
